Abstract A chiral tricyclic terpene possessing a 6,6,6-tricyclic framework and a 3,3-dimethyl-7-oxooctylidenyl side chain undergoes a double ring-closing reaction to give two chiral pentacyclic terpenes in a ratio of $4: 3$ via an intramolecular Michael addition followed by aldol condensation under basic conditions. Three new stereogenic centers are introduced in the initial Michael annulation reaction. Stereoselective installation of an ethoxycarbonyl group at C17 of the two pentacyclic terpenes separately gives the corresponding highly functionalized pentacyclic terpenoids with seven stereogenic centers. The structures and stereochemistry of key intermediates and products are established through X-ray crystallographic analysis. A mechanism is proposed for explaining the stereochemistry in the Michael annulation reaction.

Key words 1,4-addition, chiral synthesis, double ring-closing, pentacyclic triterpenes, tandem Michael-aldol annulation

Pentacyclic triterpenes are widely found in more than 90\% of Diospyros (Syn: Persimmon, ebony) plants. ${ }^{1,2}$ They are biosynthesized through the cyclization of squalene and usually contain over seven asymmetric centers. The genus Diospyros consists of tropical trees and shrubs and is known for its medicinal usage. ${ }^{1-3}$ Many important biological activities are associated with oleanane-type pentacyclic triterpenes such as anticancer, ${ }^{4}$ anti-inflammatory, ${ }^{5}$ antimicrobial, ${ }^{1,6}$ anti-obesity, ${ }^{7}$ kinase inhibition, ${ }^{8}$ vasodilation, ${ }^{9-}$ ${ }^{11}$ and anti-HIV activities. ${ }^{12}$ Figure 1 shows three representative bioactive pentacyclic triterpenes of the oleanane type. $\delta$-Oleanolic acid (1), isolated from the leaves of loquat, possesses anti-inflammatory, antitumor-promoting, ${ }^{13}$ and cholesterol ester transfer protein inhibitory ${ }^{14}$ effects. Erythrodiol (2), an olive oil constituent, was found to enhance cholesterol efflux via an increase of the ATP-binding cassette transporter A1 (ABCA1) protein level in human macrophages. ${ }^{15}$ Myriceric acid A (3), isolated from twigs of

Myrica cerifera, is a potent endothelin receptor antagonist, which can be used in the study of hypertension and vascular spasm. ${ }^{10,16}$

(+)-Myriceric acid A (3)
Figure 1 Representative bioactive pentacyclic triterpenoids

In the pursuit of asymmetric synthesis of bioactive pentacyclic triterpenes, two isomeric pentacyclic enone molecules, (-)-4 and (+)-5, were anticipated to be assembled in a one-pot double intramolecular tandem Michael-aldol condensation reaction from tricyclic keto-enone (-)-6, as illustrated in the retrosynthetic analysis shown in Scheme 1. Keto-enone (-)-6 could be prepared from a Mukaiyama aldol condensation of a reported tricyclic ketone (-)-7 (>98\% ee) $)^{17}$ and 7 -oxooctanal 8. Pentacyclic terpenes (-)-4 and $(+)-5$ possess seven asymmetric centers and all the asymmetric centers of (-)-4 are identical to those of oleanane triterpenes. These two molecules may serve as chemical probes for mechanistic studies of oleanane bioactivities due to their differences at C17 and C18. Previously, tandem

Michael-aldol ring-closing reactions of a cyclohexyl ketoenester ${ }^{18}$ and enol silyl ethers of cyclohexanone tethered with 2-alkenyl esters ${ }^{19}$ have been reported under Lewis acid conditions to construct 4,5,6-tricyclic systems and tricyclo[4.2.1.0 ${ }^{3,8}$ ]nonanes, respectively. Tadano et al. ${ }^{20}$ reported a four-step sequence of reactions to prepare a $5,6,6-\mathrm{tri}-$ cyclic system from a keto-enester tetrahydrofuran through a Michael addition-reduction-oxidation-aldol process. In addition, Mischne described a two-step annulation procedure of an $\alpha, \beta$-enedionyl alkanone under basic conditions to give a 6,6-bicyclic ring system. ${ }^{21}$ The reported systems involved ene esters or an enedione as the synthetic intermediates. A one-pot tandem Michael-aldol double annulation reaction of an exocyclic enone system, such as (-)-6, for the regioselective construction of a 6,6,6-tricyclic skeleton has not been reported previously.

Multiple fused six-membered ring systems are often synthesized by intramolecular Diels-Alder reactions ${ }^{22}$ and cation- $\pi$ cyclizations, ${ }^{23}$ whilst a successful tandem intramolecular Michael-aldol double annulation reaction under weakly basic conditions may afford an alternative pathway for the construction of pentacyclic triterpenes possessing various functional groups, substituents, and stereogenic centers. Accordingly, we investigated the synthesis of pentacyclic terpenes starting from a previously reported optically pure tricyclic ketone (-)-7 ( $>98 \%$ ee). ${ }^{17}$ We adapted Mukaiyama's aldol addition reaction ${ }^{24}$ of enol silyl ether $(-)-9$ and aldehyde 8 for the synthesis of intermediate (-)-6. Enol silyl ether (-)-9 was readily synthesized in $98 \%$ yield from the treatment of ketone (-)-7 with 1.2 equivalents of lithium diisopropylamide (LDA) in THF at $-78{ }^{\circ} \mathrm{C}$ followed by trimethylsilyl chloride (TMSCl) (Scheme 2). The exocyclic enone (-)-6 was obtained in $71 \%$ overall yield by a sequence of reactions: (i) coupling of (-)-9 and $\mathbf{8}$ in the pres-
ence of 2.5 equivalents of $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ in dichloromethane at $-78{ }^{\circ} \mathrm{C}$, (ii) mesylation of the resulting $\beta$-hydroxy ketone with methanesulfonyl chloride ( MsCl ) and triethylamine in diethyl ether, and (iii) $\beta$-elimination with 1,8 -diazabicyc-lo[5.4.0]undec-7-ene (DBU) in a mixture of dichloromethane and toluene. Only one stereoisomer at the alkene function, i.e., with $E$-stereochemistry, was isolated, and no $Z$ isomer was detected. The alkene stereochemistry of (-)-6 was confirmed by a single-crystal X-ray analysis (Figure 2; CCDC 1922116). ${ }^{25}$ The one-pot tandem Michael-aldol condensation reaction of (-)-6 was affected by treatment with 2 equivalents of sodium ethoxide in ethanol at $55^{\circ} \mathrm{C}$ to give a mixture of $(-)-10$ and $(+)-\mathbf{1 1}$ in a ratio of 4:3. They were separated by silica gel column chromatography and the structure of (+)-11 was established from a single-crystal Xray analysis (Figure 3; CCDC 1922117), ${ }^{25}$ revealing the stereochemistry of the newly generated stereogenic centers at $\mathrm{C} 13,17$, and 18 . The stereochemistry at C 13 and C 18 of (-)10 was determined from the single-crystal X-ray structure of (+)-5 (vide infra), while the stereochemistry at C17 was based on the following assumptions (Scheme 2). It is likely that Z-enolate 6A forms predominantly from the deprotonation of (-)-6 with sodium ethoxide in ethanol or the $Z$ enolate 6A undergoes a Michael addition reaction faster than the corresponding $E$-enolate (Scheme 2). The sodium ion of the enolate is solvated by ethanol and a loose or acyclic transition state for the formation of the enolate ion results, leading to a greater ratio of $Z / E$ enolates. ${ }^{26}$ The $E$-enolate has a greater repulsion derived from the cis-stereochemistry of the C15 (methyl) and C22 alkyl substituent than that of the $Z$-enolate (due to solvation of the sodium ion). Z-Enolate 6A approaches the enone moiety from the $\beta$-face (or upper face) with the C17-C22 and C18-C19 bonds in gauche orientation, providing a stable chair

Scheme 1 Retrosynthesis of pentacyclic terpenoids via a double intramolecular tandem Michael-aldol annulation reaction
conformation of the E ring in the transition state. The resulting C13,14-enolate undergoes protonation from the $\beta$ face (upper face), since a more stable anti-C18,C26 stereochemistry (10A) is formed. On the other hand, protonation at the $\alpha$-face (or down face) of the C13,14-enolate would provide a less stable stereoisomer, deriving from a 1,3-diaxial interaction between the C26 methyl and C18-cyclohexyl ring. Similarly, Z-enolate 6A can approach the enone moiety from the $\alpha$-face (or down face) with the C17-C22 and C18C19 bonds in gauche orientation, providing a chair conformation of the E ring, which subsequently undergoes protonation from the $\beta$-face to give 11A. The approach from the $\alpha$-face is slightly less favorable since the concave face of the tricyclic structure is more crowded than the convex face. The plausible mechanism explains the trans-stereochemistry at C17 and C18 and the ratio of 4:3 of (-)-10 and (+)-11.

Figure 2 ORTEP drawing of the single-crystal X-ray analysis of compound (-)-6; CCDC 1922116. Selected bond lengths ( $\AA$ ) and angles ( ${ }^{\circ}$ ): C5-C10 1.554(5), C8-C9 1.574(5), C9-C10 1.561(5), C8-C14 1.530(6), C14-O3 1.216(5), C13-C14 1.503(6), C13-C18 1.343(7), C16-O4 1.230(10); C2-C3-C4 112.8(3), C3-C4-C5 107.9(3), C1-C10-C5 108.3(3), C8-C9-C10 115.5(3), C7-C8-C14 109.0(3), C13-C14-O3 121.2(4), C14-C13-C18 117.6(5), C17-C16-O4 122.4(6)

The installation of an ester moiety at C17 was accomplished by the treatment of (-)-10 and (+)- $\mathbf{1 1}$ separately with LDA in THF at $-78^{\circ} \mathrm{C}$, followed by the addition of ethyl cyanoformate to give a $45 \%$ yield of (+)-5 and $65 \%$ yield of $(-)-4$, respectively (Scheme 2 ). The structure of $(+)-\mathbf{5}$ was firmly determined from a single-crystal X-ray analysis (Figure 4; CCDC 1922118). ${ }^{25}$ It appears that the cyanoformate reacted with the enolate of $(-)-\mathbf{1 0}$ from the $\alpha$-face, the same face as that of the C18-hydrogen, resulting in less repulsion from the ethyl ester group with $\mathrm{C} 18-\mathrm{H}$ than the C 19 alkyl. This produced the syn-stereochemistry of $\mathrm{C} 17-\mathrm{CO}_{2} \mathrm{Et}$ and

Figure 3 ORTEP drawing of the single-crystal X-ray analysis of compound (+)-11; CCDC 1922117. The synthesis of 7-oxooctanal $\mathbf{8}$ was accomplished by a key 1,4 -addition reaction of the cuprate reagent derived from 5-bromo-4,4,-dimethylpentene (13) with methyl vinyl ketone. Bromide 13 was generated from 2,2-dimethyl-4-pentenal (12), the preparation of which was readily achieved via a reported Claisen rearrangement procedure ${ }^{27}$
(Scheme 3). Hence, condensation of allyl alcohol and isobutyraldehyde in the presence of $1 \%$ of $p$-toluenesulfonic acid (TsOH) in mesitylene at $220^{\circ} \mathrm{C}$ gave a $90 \%$ yield of aldehyde 12. This aldehyde was reduced with sodium borohydride in methanol at $25^{\circ} \mathrm{C}$ followed by bromination with triphenylphosphine and bromine in DMF to furnish a $59 \%$ overall yield of bromide $13 .{ }^{28}$ For the 1,4 -addition reaction, attempted generation of the required organometallic reagent from bromide $\mathbf{1 3}$ with $t$-BuLi, $n$-BuLi, or magnesium turnings under various reaction conditions failed. ${ }^{28}$ The required Grignard reagent, 2,2-dimethyl-4-pentenylmagnesium bromide, was eventually prepared from 13 by using activated magnesium metal. The activated magnesium was
prepared by following a reported method, ${ }^{29}$ involving treatment of magnesium turnings with a catalytic amount of anthracene and 1,2-dibromoethane ( $2.5 \mathrm{~mol} \%$ each) in THF. Treatment of this Grignard reagent with cuprous iodide-dimethyl sulfide complex in a mixture of dimethyl sulfide and diethyl ether at $-20^{\circ} \mathrm{C}$ followed by methyl vinyl ketone afforded a $57 \%$ yield of alkenone 14 . The conversion of 14 into 7 -oxooctanal $\mathbf{8}$ ( $56 \%$ yield) was performed by oxidative cleavage of the alkene function of 14 with a catalytic amount of osmium tetroxide and sodium periodate in a mixture of 1,4-dioxane and water.

Scheme 2 Synthesis of pentacyclic terpenes (-)-4 and (+)-5

The single-crystal X-ray structural analyses were carried out on molecules (-)-6, (+)-11, and (+)-5, and their formulas, crystal data, methods of collection, and methods of structure solution and refinement are listed in Table $1 .{ }^{25}$ The X-ray structures have been deposited at The Cambridge Crystallographic Data Centre and details of the data collection and structural solutions and refinement are described in the Supporting Information. Selected bond lengths and angles are summarized in Figures $2-4$. The single-crystal Xray analyses confirm the structural assignments of the three molecules.

In summary, a facile synthesis of chiral pentacyclic terpenes, possessing seven asymmetric centers and four functional groups, from a chiral tricyclic terpene has been accomplished in six steps and involving a tandem intramolecular Michael-aldol condensation reaction. Two stereoisomers at carbons 17 and 18 are produced in the initial Michael addition reaction, likely due to the addition of Z-enolate $\mathbf{6 A}$ onto the enone moiety from both the $\beta$ - and $\alpha$-faces. Subsequent protonation of the resulting cyclic enolate ion from the $\beta$-face is stereoselective. The C3-cyclic acetonide protecting group can be removed to prepare ketone or alcohol derivatives, and stereoselective introduction of a

anthracene (cat.);
(ii) $\mathrm{Cul} \cdot \mathrm{Me}_{2} \mathrm{~S}$
$\mathrm{CH}_{3} \mathrm{COCH}=\mathrm{CH}_{2}$

Scheme 3 Synthesis of 3,3-dimethyl-7-oxooctanal (8)
substituent, such as a cyano group, onto C 14 (from the $\alpha-$ face) of (-)-4 and (+)-5 is possible. ${ }^{17}$ Hence, the synthesized chiral pentacyclic terpenes may be converted into various bioactive natural products.

Chemicals were purchased from Fisher Scientific, VWR international LLC, and Chem-Impex International, Inc. All solvents were dried over appropriate drying agents, for example, $\mathrm{CaH}_{2}$ (for DMF, dichloromethane, and acetonitrile) and Na /benzophenone (for THF and diethyl ether), followed by distillation. Column chromatography was carried out on silica gel (200-400 mesh; from Natland International Co., Research Triangle Park, NC). Melting points were determined using a Thomas Hoover Uni-melt apparatus. Specific rotations were recorded using a Perkin-Elmer model 241 polarimeter. ${ }^{1} \mathrm{H}$ NMR ( 400 MHz ) and ${ }^{13} \mathrm{C}$ NMR spectra ( 100 MHz ) were recorded on a Varian Unity plus $400-\mathrm{MHz}$ spectrometer or a Bruker Avance Neo $400-\mathrm{MHz}$ NMR spectrometer, and measured from a solution in $\mathrm{CDCl}_{3}$ unless otherwise mentioned. The chemical shift data for each signal are given in units of $\delta$ relative to TMS $(\delta=0)$ or $\mathrm{CHCl}_{3}(\delta=7.26)$ for ${ }^{1} \mathrm{H}$ NMR spectra and relative to $\mathrm{CDCl}_{3}(\delta=77.0)$ for ${ }^{13} \mathrm{C}$ NMR spectra. Mass spectra were obtained using an API 2000-triple quadrupole ESI-MS/MS mass spectrometer (Applied Biosystems). High-resolution mass spectra were obtained using an LCT Premier (Waters Corp., Milford MA) time-offlight mass spectrometer. The instrument was operated at 10,000 resolution (W mode) with dynamic range enhancement that attenuates large intensity signals. Mass correction for exact mass determinations was made automatically with the lock mass feature in the MassLynx data system. A reference compound in an auxiliary sprayer is sampled every third cycle by toggling a 'shutter' between the analysis and reference needles. The reference mass is used for a linear mass correction of the analytical cycles. Single-crystal X-ray structures were obtained using a Siemens SMART 1000 low-temperature (LT-2A) singlecrystal X-ray diffractometer and a Bruker MicroStar microfocus rotating anode operating at 45 kV and 60 mA , and equipped with Helios high-brilliance multilayer X-ray optics.

## (-)-Trimethyl\{(4a'R,8a'R)-1',1',4a',8a'-tetramethyl-3',4',4a',4b',5',6',8a',9',10',10a'-decahydro-1'H-spiro[[1,3]-dioxolane-2,2'-phenanthrene]-8'-yloxy\}silane [(-)-9]

Trimethylsilyl chloride (TMSCl) was distilled over $\mathrm{CaH}_{2}$ and then mixed with distilled $\mathrm{Et}_{3} \mathrm{~N}$ (in a ratio of $7: 1$ for TMSCl and $\mathrm{Et}_{3} \mathrm{~N}$ ). The resulting suspension was centrifuged for 10 min and the clear supernatant was used for the silylation reaction. To a cold $\left(-78^{\circ} \mathrm{C}\right)$ solution of diisopropylamine ( $50 \mu \mathrm{~L}, 0.35 \mathrm{mmol}$ ) in dry THF ( 1.5 mL ) under argon was added $n-B u L i(0.21 \mathrm{~mL}, 1.6 \mathrm{M}$ in hexane, 0.33 mmol$)$ and the solution was stirred for 30 min . To a cold $\left(-78^{\circ} \mathrm{C}\right)$ solution of $(-)-7$ ( $0.10 \mathrm{~g}, 0.33 \mathrm{mmol},>98 \% \mathrm{ee})^{17}$ in THF ( 2 mL ) under argon was added the above LDA solution via cannula. The solution was stirred at $25^{\circ} \mathrm{C}$ for 2 h , cooled to $-78{ }^{\circ} \mathrm{C}$. TMSCl ( $0.14 \mathrm{~mL}, 1 \mathrm{mmol}$ ) was added and the mixture was stirred at $-78^{\circ} \mathrm{C}$ for 30 min . The reaction solution was diluted with $5 \%$ aqueous $\mathrm{NH}_{4} \mathrm{OH}$ solution ( 20 mL ) and extracted with diethyl ether $(3 \times 20 \mathrm{~mL})$. The combined organic layer was washed with water and brine, dried (anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ), concentrated, and column chromatographed on silica gel using a mixture of hexane, dichloromethane and diethyl ether (5:3:1) as eluent to give pure (-)-9.

## 2,2-Dimethylpent-4-enal (12) ${ }^{27}$

To a round-bottom flask equipped with a Vigreux column ( 30 cm length), a Dean-Stark apparatus, and a reflux condenser, were added allyl alcohol ( $21.7 \mathrm{~g}, 0.375 \mathrm{~mol}$ ), isobutyraldehyde ( $40.5 \mathrm{~g}, 0.56 \mathrm{~mol}$ ), p-toluenesulfonic acid ( $0.125 \mathrm{~g}, 6.5 \mathrm{mmol}$ ) and mesitylene ( 70 mL ). The solution was stirred and heated at $220^{\circ} \mathrm{C}$ for 48 h , and during this time water was collected in the Dean-Stark apparatus. The solution was cooled to $25^{\circ} \mathrm{C}$ and distilled under normal pressure to give aldehyde 12.
Yield: 40 g (90\%); colorless liquid; bp $124-125^{\circ} \mathrm{C} / 760 \mathrm{~mm}$ (Lit. ${ }^{27} 124-$ $126^{\circ} \mathrm{C}$ ).
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=9.50(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CHO}), 5.77-5.67(\mathrm{~m}, 1 \mathrm{H}$, $=\mathrm{CH}$ ), $5.11-5.06\left(\mathrm{~m}, 2 \mathrm{H},=\mathrm{CH}_{2}\right), 2.23\left(\mathrm{~d}, \mathrm{~J}=7.6 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.07(\mathrm{~s}, 6$ $\mathrm{H}, 2 \mathrm{CH}_{3}$ ).

The spectral data are in agreement with those reported. ${ }^{27}$

## 2,2-Dimethylpent-4-en-1-ol

To a solution of aldehyde $12(40.0 \mathrm{~g}, 0.35 \mathrm{~mol})$ in $\mathrm{MeOH}(400 \mathrm{~mL})$ was added a solution of sodium borohydride ( $4.8 \mathrm{~g}, 0.13 \mathrm{~mol}$ ) in 0.2 M aqueous $\mathrm{NaOH}(60 \mathrm{~mL})$ slowly over 30 min . The resulting solution was stirred at $25^{\circ} \mathrm{C}$ for 10 h , concentrated on a rotary evaporator, diluted with aqueous $10 \% \mathrm{NH}_{4} \mathrm{Cl}$ solution ( 50 mL ), and extracted with diethyl ether $(3 \times 100 \mathrm{~mL})$. The combined organic layers were washed with water and brine, dried $\left(\mathrm{MgSO}_{4}\right)$, concentrated, and column chromatographed on silica gel using a mixture of hexane and diethyl ether (1:1) as eluent to give 2,2-dimethylpent-4-en-1-ol
Yield: 38 g (90\%); colorless oil.
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=5.94-5.82(\mathrm{~m}, 1 \mathrm{H},=\mathrm{CH}), 5.07-5.04(\mathrm{~m}$, $2 \mathrm{H},=\mathrm{CH}_{2}$ ), $3.34\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{O}\right), 2.03\left(\mathrm{~d}, \mathrm{~J}=8.0 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 0.89(\mathrm{~s}, 6$ $\mathrm{H}, 2 \mathrm{CH}_{3}$ ).
The spectral data are in agreement with those reported. ${ }^{24}$

## 5-Bromo-4,4-dimethylpentene (13) ${ }^{28}$

To a solution of triphenylphosphine ( $12.0 \mathrm{~g}, 45.9 \mathrm{mmol}$ ) in DMF (30 mL ) under argon was added bromine ( $7.7 \mathrm{~g}, 48.8 \mathrm{mmol}$ ) and the resulting mixture was stirred for 30 min . A solution of 2,2-dimethyl-4-penten-1-ol ( $5.0 \mathrm{~g}, 43.8 \mathrm{mmol}$ ) in DMF ( 30 mL ) was added slowly and the resulting black solution was heated at $130^{\circ} \mathrm{C}$ for 2 h , cooled to $25^{\circ} \mathrm{C}$, and diluted with water ( 70 mL ). The mixture was extracted with pentane $(3 \times 100 \mathrm{~mL})$, and the combined organic layer was washed with water and brine, and dried $\left(\mathrm{MgSO}_{4}\right)$. The pentane solvent was distilled off under normal pressure and the residue was distilled at $180^{\circ} \mathrm{C}$ to give bromide 13 with a pleasant odor.

Yield: 4.5 g (65\%); colorless liquid.
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=5.83-5.72(\mathrm{~m}, 1 \mathrm{H},=\mathrm{CH}), 5.12-5.07(\mathrm{~m}$, $\left.2 \mathrm{H},=\mathrm{CH}_{2}\right), 3.28\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Br}\right), 2.11\left(\mathrm{~d}, \mathrm{~J}=7.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.02(\mathrm{~s}, 6$ $\mathrm{H}, 2 \mathrm{CH}_{3}$ ).
The spectral data are in agreement with those reported. ${ }^{28}$

## 6,6-Dimethyl-8-nonen-2-one (14)

Activation of magnesium: magnesium turnings were washed with 1 N HCl solution several times until a shiny surface appeared, and then washed with (i) distilled water several times to remove HCl , (ii) methanol, and (iii) diethyl ether. The resulting magnesium was dried under vacuum for 1 h at $50^{\circ} \mathrm{C}$ to give activated magnesium. To a mixture of activated magnesium ( $7.0 \mathrm{~g}, 0.23 \mathrm{~mol}$ ) and anthracene ( $1.0 \mathrm{~g}, 5.6$ mmol ) in dry THF ( 100 mL ) under argon was added 1,2-dibromoethane ( $0.5 \mathrm{~mL}, 5.7 \mathrm{mmol}$ ), and the mixture was stirred under reflux for 5 min . After cooling to $25^{\circ} \mathrm{C}$, the mixture was stirred for 14 h to give a green-orange colored mixture (a green color appeared after stirring for 1 h ). To this solution was added 5 -bromo-4,4-dimethylpentene ( $\mathbf{1 3}$ ) ( $1.0 \mathrm{~g}, 5.7 \mathrm{mmol}$ ) and the mixture was heated under reflux with a heat gun. Subsequently, additional bromide 13 ( $7.0 \mathrm{~g}, 39.8$ mmol ) was added slowly via a syringe to maintain a gentle reflux of the THF. After completion of the addition of 13, the mixture was stirred at $25^{\circ} \mathrm{C}$ for 30 min , heated at reflux for 2 h , and then cooled to $25^{\circ} \mathrm{C}$ to give a black-colored Grignard reagent. To a three-neck flask equipped with a thermometer were added cuprous iodide-dimethyl sulfide complex (CuI•Me ${ }_{2} \mathrm{~S}$ ), ( $5.75 \mathrm{~g}, 27.8 \mathrm{mmol}$ ), dimethyl sulfide ( 15 mL ) and dry diethyl ether ( 20 mL ) under argon. The mixture was cooled to $-40^{\circ} \mathrm{C}$ and the aforementioned Grignard reagent was added via a cannula slowly to maintain the temperature below $-30^{\circ} \mathrm{C}$. The mixture was stirred for 40 min at $-20^{\circ} \mathrm{C}$, cooled to $-40^{\circ} \mathrm{C}$ and treated with a solution of methyl vinyl ketone ( $1.4 \mathrm{~g}, 26.1 \mathrm{mmol}$ ) in diethyl ether ( 3 mL ). The mixture was stirred for 2 h at $10^{\circ} \mathrm{C}$, diluted with a mixture of aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ and $\mathrm{NH}_{4} \mathrm{OH}(200 \mathrm{~mL}, 4: 1)$ and stirred for 10 min . The resulting blue solution was extracted with diethyl ether $(4 \times 50 \mathrm{~mL})$ and the combined organic layers were washed twice with $10 \%$ aqueous $\mathrm{NH}_{4} \mathrm{OH}$, water, and brine, dried $\left(\mathrm{MgSO}_{4}\right)$, and distilled under normal pressure to remove diethyl ether and THF. The residue was column chromatographed on silica gel using a mixture of hexane and diethyl ether (15:1) as eluent to give ketone 14.

Yield: 1.6 g (57\%); yellow oil.
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=5.84-5.73$ (m, $1 \mathrm{H},=\mathrm{CH}$ ), $5.01-4.94$ (m, $\left.2 \mathrm{H},=\mathrm{CH}_{2}\right), 2.38\left(\mathrm{t}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{COCH}_{2}\right), 2.12\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{COCH}_{3}\right), 1.94$ (d, $J=7.6 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{C}=$ ), 1.58-1.49 (m, 2 H ), 1.16-1.12 (m, 2 H$), 0.85$ (s, $6 \mathrm{H}, 2 \mathrm{CH}_{3}$ ).

HRMS-ESI: $m / z[M+N a]^{+}$calcd for $\mathrm{C}_{11} \mathrm{H}_{20} \mathrm{NaO}: 191.1406$; found: 191.1410.

## 3,3-Dimethyl-7-oxooctanal (8)

To a solution of ketone $14(1.0 \mathrm{~g}, 6.0 \mathrm{mmol})$ in 1,4-dioxane ( 30 mL ) and $\mathrm{H}_{2} \mathrm{O}(6 \mathrm{~mL})$ at $25^{\circ} \mathrm{C}$ was added $\mathrm{OsO}_{4}(12 \mathrm{mg}, 0.06 \mathrm{mmol})$. The solution was stirred for 40 min to give a dark brown mixture. Sodium periodate ( $2.5 \mathrm{~g}, 12 \mathrm{mmol}$ ) was added in portions over 20 min , and the resulting solution was stirred at $25^{\circ} \mathrm{C}$ for 4 h , diluted with water $(50 \mathrm{~mL})$, and extracted with diethyl ether ( $4 \times 40 \mathrm{~mL}$ ). The combined organic layers were washed with water and brine, dried $\left(\mathrm{MgSO}_{4}\right)$, and distilled under normal pressure to remove diethyl ether and most of the 1,4-dioxane. The crude product was purified by silica gel column chromatography using a mixture of hexane and diethyl ether (1:1) as eluent to give aldehyde 8.
Yield: 0.52 g (56\%); light yellow oil.
${ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=9.83(\mathrm{t}, \mathrm{J}=3.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CHO}), 2.42(\mathrm{t}$, $\left.J=6.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{COCH}_{2}\right), 2.27\left(\mathrm{~d}, J=3.2 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CHO}\right), 2.13(\mathrm{~s}, 3 \mathrm{H}$, $\mathrm{COCH}_{3}$ ), 1.61-1.53 (m, 2 H$), 1.32-1.27(\mathrm{~m}, 2 \mathrm{H}), 1.05\left(\mathrm{~s}, 6 \mathrm{H}, 2 \mathrm{CH}_{3}\right)$.

[LDA was prepared by following the procedure described in the synthesis ( - )-9 and was titrated prior to use]. To a cold $\left(-78^{\circ} \mathrm{C}\right)$ solution of ( - )- $\mathbf{- 1 0}(0.173 \mathrm{~g}, 0.38 \mathrm{mmol})$ in THF ( 2 mL ) under argon was added a solution of LDA ( 0.57 mmol ) in THF ( 1 mL ) by syringe. The resulting solution was stirred at $-78^{\circ} \mathrm{C}$ for $1 \mathrm{~h}, \operatorname{HMPA}(0.102 \mathrm{~g}, 0.57 \mathrm{mmol})$ was added and the mixture was stirred for 15 min . Next, ethyl cyanoformate ( $75 \mathrm{mg}, 0.76 \mathrm{mmol}$ ) was added and the mixture was stirred for 30 min . The reaction mixture was diluted with aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution and extracted with ethyl acetate $(3 \times 20 \mathrm{~mL})$. The combined organic layers were washed with water and brine, dried $\left(\mathrm{MgSO}_{4}\right)$, concentrated, and column chromatographed on silica gel using a mixture of hexane, dichloromethane and diethyl ether ( $8: 3: 1$ ) as eluent to give pure (+)-5.
Yield: 90 mg ( $45 \%$ ); white solid; $\mathrm{mp} 153-155^{\circ} \mathrm{C} ;[\alpha]_{\mathrm{D}}{ }^{25}=91.3$ (c $0.425, \mathrm{CHCl}_{3}$ ).
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=5.79(\mathrm{~s}, 1 \mathrm{H},=\mathrm{CH}), 4.16-4.06(\mathrm{~m}, 2 \mathrm{H}$, $\mathrm{CO}_{2} \mathrm{CH}_{2}$ ), $3.95-3.84\left(\mathrm{~m}, 4 \mathrm{H}, 2 \mathrm{OCH}_{2}\right), 2.54(\mathrm{dd}, J=12.8,4.4 \mathrm{~Hz}, 1 \mathrm{H})$, 2.34 (ddd, $J=13.6,7.2,3.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.15(\mathrm{dd}, J=13.6,3.6 \mathrm{~Hz}, 1 \mathrm{H})$, 1.92 (d, $J=12.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.80(\mathrm{td}, J=13.6,3.2 \mathrm{~Hz}, 2 \mathrm{H}), 1.71-1.57$ (m, 5 H ), $1.51-1.28(\mathrm{~m}, 6 \mathrm{H}), 1.24\left(\mathrm{t}, \mathrm{J}=7.6 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{O}_{2} \mathrm{C}\right), 1.18-$ $1.10(\mathrm{~m}, 5 \mathrm{H}), 1.08\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 0.98\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 0.94\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$, $0.92\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 0.85\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 0.83\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.
${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=197.2,174.6,172.3,117.8,113.2,65.2$ (2 C), 61.4, 58.6, 55.6, 53.6, 43.6, 42.9, 42.4, 41.4, 39.5, 38.3, 38.1, 37.1, $34.96,34.95,32.9,30.6,27.5,27.1,24.6,23.2,22.0,21.3,20.2,18.7$, 16.4, 14.3.

MS (EI): $m / z(\%)=549.4(100)[M+N a]^{+}$.
HRMS-ESI: $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{33} \mathrm{H}_{50} \mathrm{NaO}_{5}$ : 549.3556 ; found: 549.3559.

The product was crystallized from a mixture of diethyl ether and hexane (1:1) to give single crystals and the structure was solved by X-ray analysis.

## (-)-(6a'R,8a'R,12a'S,12b'R,14b'R)-Ethyl 4',4',6a',11',11',14b'-Hexa-methyl-8'-oxo-2', 4',4a', $5^{\prime}, 6^{\prime}, 6 a^{\prime}, 8^{\prime}, 8 a^{\prime}, 9^{\prime}, 10^{\prime}, 11^{\prime}, 12^{\prime}, 12 a^{\prime}, 12 b^{\prime}, 13^{\prime}, 14^{\prime}$, 14a',14b'-octadecahydro- $\mathbf{1}^{\prime} \mathrm{H}$-spiro[[1,3]dioxolane-2,3'-picene]-8a'-carboxylate [(-)-4]

To a cold ( $-78^{\circ} \mathrm{C}$ ) solution of $(+)-\mathbf{1 1}(40 \mathrm{mg}, 0.088 \mathrm{mmol})$ in dried diethyl ether ( 1 mL ) under argon was added freshly prepared LDA ( 0.12 mmol ) in diethyl ether ( 1 mL ), and the solution was stirred at $-78{ }^{\circ} \mathrm{C}$ for 1 h . HMPA ( $24 \mathrm{mg}, 0.12 \mathrm{mmol}$ ) was added and the mixture was stirred at $-78{ }^{\circ} \mathrm{C}$ for 15 min . Next, ethyl cyanoformate ( $18 \mathrm{mg}, 0.17$ mmol ) added and the mixture was for 30 min . The reaction mixture was diluted with aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution and extracted with ethyl acetate $(3 \times 10 \mathrm{~mL})$. The combined organic layers were washed with
water and brine, dried $\left(\mathrm{MgSO}_{4}\right)$, concentrated, and column chromatographed on silica gel using a mixture of hexane, dichloromethane and diethyl ether (6:3:1) as eluent to give pure (-)-4.
Yield: 30 mg (65\%); white solid; mp 205-207 ${ }^{\circ} \mathrm{C} ;[\alpha]_{\mathrm{D}}{ }^{25}=-62.8$ (c $0.20, \mathrm{CHCl}_{3}$ ).

## Funding Information

The research reported in this publication was supported in part by the American Heart Association, Heartland Affiliate (0750115Z) and the National Science Foundation, Division of Chemistry (CHE1662705). This material was based upon work in part supported by the National Science Foundation, Division of Chemistry for the purchase of an NMR spectrometer (1826982 to D.H.H.) and for the purchase of an X-ray diffractometer and the software used in this study (CHE-0923449 to V.W.D.).

## Acknowledgment

S.K. thanks the Council of Higher Education of Turkey for a research fellowship.
